

ABSTRACT

A slender synthetic resin heat-resistant bottle type container having a circumferential draw ratio of 2.8 or less, for example, comprises pressure reduction absorbing panels (5) provided at a container body part, wherein the pressure reduction absorbing panels are each provided with at least one convex portion (6) having a width larger at a lower side than at an upper side as viewed in a circumferential direction of the container, and/or the pressure reduction absorbing panels each have a border line bulged toward a container bottom part, thereby causing a resin to be smoothly stretched even at mold surface portions corresponding to concaves and convexes of a container body part surface upon blow molding, thereby avoiding occurrence of a defective appearance of the container and eliminating an affection on heat resistance thereof.
